

## Lesson 7.4

# Arcs and Angles

Many arches that you see in structures are semicircular, but the Chinese long ago discovered that arches don't have to be semicircular. The Zhaozhou bridge, shown at left, was completed in A.D. 605. It is the world's first stone arched bridge in the shape of a minor arc, predating similar structures by about 800 years.

In this lesson you'll discover properties of arcs and the angles associated with them.

Recall that the measure of a minor arc is the measure of its central angle. The measure of a major arc is  $360^\circ$  minus the measure of the minor arc making up the remainder of the circle. How does the measure of an inscribed angle compare with the measure of its intercepted arc? Let's investigate.

### Investigation 7.4.1

- Step 1 Measure  $\angle COR$  with your protractor and determine  $m\widehat{CR}$ .
- Step 2 Measure  $\angle CAR$ . How does  $m\angle CAR$  compare with  $m\widehat{CR}$ ?
- Step 3 Construct a circle of your own with an inscribed angle and its corresponding central angle.
- Step 4 Measure the central angle. What is the measure of the intercepted arc?
- Step 5 Measure the inscribed angle. How does the measure of the inscribed angle compare with the measure of its intercepted arc?

Compare your results with the results of others. State a conjecture.

**C-68** The measure of an inscribed angle in a circle —?—  
(*Inscribed Angle Conjecture*).

In the figure at right,  $\angle AQB$  and  $\angle APB$  both intercept  $\widehat{AB}$ . Angles  $AQB$  and  $APB$  are both inscribed in  $\widehat{APB}$ . Angles  $AQB$  and  $APB$  appear congruent. Can you find angles inscribed in the same arc that are not congruent? Let's investigate.

### Investigation 7.4.2

- Step 1 Construct a large circle.
- Step 2 Select two points on the circle. Label them  $A$  and  $B$ .
- Step 3 Select a point  $P$  on the major arc and construct inscribed  $\angle APB$ .
- Step 4 With your protractor, measure  $\angle APB$ .
- Step 5 Select another point  $Q$  on major arc  $APB$  and construct inscribed  $\angle AQB$ .
- Step 6 Measure  $\angle AQB$ . How does the measure of  $\angle AQB$  compare with the measure of  $\angle APB$ ?

Repeat Steps 1-6 with points  $P$  and  $Q$  selected on the minor arc  $AB$ . Compare the measure of  $\angle AQB$  with the measure of  $\angle APB$ . Compare your results with the results of others near you. Do you think you can find an angle inscribed in  $\widehat{APB}$  that is not congruent to  $\angle APB$ ? State your observations as a conjecture.

**C-69** Inscribed angles that intercept the same arc are —?—.

Next you will discover a property of angles inscribed in semicircles.

### Investigation 7.4.3

- Step 1 Construct a large circle.
- Step 2 Construct a diameter.
- Step 3 Inscribe three angles in the same semicircle.
- Step 4 Measure each angle with your protractor.

Compare your results with the results of others and make a conjecture.

**C-70** Angles inscribed in a semicircle are —?—.

Now you will discover a property of the angles of a quadrilateral inscribed in a circle.

### Investigation 7.4.4

- Step 1 Construct a large circle.
- Step 2 Construct an inscribed quadrilateral.
- Step 3 Measure each of the four inscribed angles. Write the measure in each angle.

It is unlikely that any of the angles are congruent, but there is a special relationship between some pairs of angles. Compare your observations with the observations of those near you. State your findings as your next conjecture.

**C-71** The  $\text{---}\text{?}\text{---}$  angles of a quadrilateral inscribed in a circle are  $\text{---}\text{?}\text{---}$ .

A quadrilateral inscribed in a circle is called a *cyclic quadrilateral*.

Next you will discover a property of arcs formed by parallel lines intersecting a circle.

### Investigation 7.4.5

- Step 1 On a piece of patty paper, construct a large circle.
- Step 2 Lay your straightedge across the circle so that its parallel edges pass through the circle. Draw lines along both edges of the straightedge. Label one arc  $AD$  and the other  $BC$ , as shown.
- Step 3 Fold your patty paper to compare arcs  $AD$  and  $BC$ .

What can you say about arcs  $AD$  and  $BC$ ? Repeat these steps, using either lined paper or another object with parallel edges. Compare your results with the results of others near you. State your observations as a conjecture.

**C-72** Parallel lines intercept  $\text{---}\text{?}\text{---}$  arcs on a circle.

### Take Another Look 7.4

1. Use a geometry computer program to construct a circle and an inscribed angle. Use a point on the circle besides the radius point for the vertex of the angle. Measure the angle and drag the vertex. What conjecture does this illustrate?

2. Extend Investigation 7.4.4 to see what other properties of cyclic quadrilaterals you can discover. A geometry computer program is a good tool for this activity, or use other tools of your choice.

3.\* Choose one of the conjectures in this lesson and explain how it follows logically from earlier conjectures.

4.\* State Conjecture 71 in "if-then" form. Then state the converse of the conjecture in "if-then" form. Is the converse also true?

5. On the surface of a sphere, investigate one or more of Conjectures 68 to 71.

6. Which of the following are always cyclic quadrilaterals: kites, isosceles trapezoids, rhombuses, rectangles, or squares? Explain why each is or is not cyclic.

# Exercise Set 7.4

Use your new conjectures to solve Exercises 1-16.

1.  $a = -?-$

2.  $b = -?-$

3.\*  $c = -?-$

4.  $d = -?-$   
 $e = -?-$

5.  $f = -?-$   
 $g = -?-$

6.\*  $h = -?-$

7. *JUST* is a rhombus.  
 $w = -?-$

8. *CALM* is a rectangle.  
 $x = -?-$

9. *DOWN* is a kite.  
 $y = -?-$

10.  $k = -?-$

11.  $m = -?-$   
 $n = -?-$

12.\*  $\overline{AB} \parallel \overline{CD}$   
 $p = -?-$   
 $q = -?-$

13.  $r = -?-$   
 $s = -?-$

14.\* What is the sum of  
 $a + b + c + d + e$ ?

15.\*  $y = -?-$

16. What's wrong with this picture?

18. How can you find the center of a circle by using just the corner of a piece of paper?

19.\* Chris Chisholm, while a high school student in Whitmore, California, used Conjecture 70 (Angles inscribed in a semicircle are . . .) to discover a new and simpler way to find the orthocenter in a triangle. He noticed that if you construct a circle, using one of the sides of the triangle as the diameter of the circle, then you can immediately find an altitude to each of the other two sides! Try it. Use Chris's method to find the orthocenter of a triangle.

20.\* The width of a view that can be captured in a photo depends on the **picture angle**. Most 35 mm cameras have a  $46^\circ$  picture angle to take a photo of your class standing in one straight row. Draw a line segment to represent the row. Draw a  $46^\circ$  angle on a piece of patty paper. Locate at least eight points where a 35 mm camera could be positioned to photograph the students standing along the segment, fill the picture as possible. What is the locus of all positions? What conjecture from this lesson activity illustrate?

21. **Computer Activity** Construct a circle and a diameter, and construct two chords to form a right triangle inscribed in the semicircle. Locate the midpoint of each of the two chords and the midpoint of the diameter. Connect the two midpoints as the vertex of the right angle. Visualizing this first, sketch the locus by hand. Then use a computer to trace the locus.

17. Find the lettered angle measures and arc measures.

-?-  
-?-  
-?-  
-?-

**Improving Reasoning Skills**

If the letter in the word *dinosaur* that also found before the sixteenth letter horizontally. Otherwise print the word letter after the first vowel.

the circumference of a circle is  $C = \pi D$ . Are the  $\frac{C}{D}$  ratios the same for every circle? We can use the formula for finding the circumference in terms of the diameter. If you know the diameter is twice the radius, then there is a number  $\pi$  (pi), pronounced "pie", that is the ratio of the circumference to the radius, then  $C = 2\pi r$ .

never ends and no pattern in the decimal alphabet. Mathematicians have not found an exact value of the

and intrigued mathematicians throughout history. The ancient Chinese used  $\frac{22}{7}$  and  $3.14$  as their approximation of  $\pi$ . In 10. By A.D. 408, Chinese mathematician Zu Chongzhi calculated  $\pi$  to millionths.
